Saubon Synogen™ Multi-User Projects Catalogue — Installation & Deployment

The Saubon Synogen™ Multi-User Projects Catalogue is designed for intranet deployment on a file server within an organisation's internal network. All application data resides on the server: project records are stored in the projects table within the projects database, and all user accounts are held in the user_accounts table within the accounts database. Project directories themselves can be stored locally on the file server or in the cloud via services such as OneDrive — the only requirement is that the storage location is accessible through a mapped drive letter (e.g. P:\). This means the application is agnostic to where project files physically reside, giving organisations flexibility to adopt cloud storage without significant changes to the platform. The application operates autonomously once deployed, with a companion backend database monitor (Enola) handling automatic record unlocking with full traceability, and health logging independently of user activity.

At the time of writing, the Saubon Synogen™ Projects Catalogue has been designed to operate on Windows 10 and Windows 11 computers. It is important that all computers within the organisation follow a homogeneous profile with regards to operating systems. Such practices are common in corporate settings and are important for the reliable operation of the Saubon Synogen™ Projects Catalogue software. A consistent operating system environment across all workstations ensures predictable behaviour, simplifies troubleshooting, and reduces the risk of compatibility issues that could disrupt day-to-day use of the application.

Google Chrome is the browser the Saubon Synogen™ Projects Catalogue has been designed to work with. The application is not a multi-browser compliant platform and is not supported on other browsers such as Microsoft Edge, Mozilla Firefox, or Safari. Typically in a corporate setting, a standard browser such as Chrome would be mandated by company IT policy on all corporate computers. Organisations deploying the Saubon Synogen™ Projects Catalogue should ensure that Google Chrome is installed and set as the default browser on all workstations that will access the application.

In the unlikely event that a Google Chrome update renders the browser incompatible with the Saubon Synogen™ Projects Catalogue software, Microsoft Edge may be used as a temporary alternative while the Chrome compatibility issues are investigated and resolved. It is important to note that using Microsoft Edge in this scenario is strictly a short-term measure and should not be considered a permanent or supported solution. Once the Chrome issues have been resolved, all users should revert to Google Chrome as their primary browser for accessing the application. Chrome remains the only fully supported and tested browser for the Saubon Synogen™ Projects Catalogue.
