Saubon Synogen™ Multi-User Projects Catalogue — Remote Access & VPN Connectivity

The Saubon Synogen™ Multi-User Projects Catalogue fully supports remote access via Virtual Private Network (VPN) connections, enabling users to securely connect to their organisation's intranet from home or any remote location as though they were physically present in the office. Because the application operates over standard network file-sharing protocols and mapped drive letters, a VPN tunnel to the office network is all that is required for remote users to access the projects database, user accounts database, and all associated project directories — whether those directories reside on a local file server or in the cloud via services such as OneDrive. No additional configuration or specialist remote-access software is needed beyond the organisation's existing VPN infrastructure. This architecture proved its value during the COVID-19 pandemic, when organisations worldwide were compelled to transition to remote working at very short notice. In any future scenario of a similar nature — whether a public health emergency, extreme weather event, or other disruption — the Saubon Synogen™ platform ensures complete business continuity by allowing the entire workforce to remain fully operational from distributed locations. The companion backend database monitor, Enola, continues to manage automatic record unlocking and health logging regardless of whether users are connected locally or remotely, maintaining full data integrity and traceability at all times. In an era where hybrid and remote working have become permanent features of the modern workplace, this seamless VPN compatibility positions the Saubon Synogen™ Multi-User Projects Catalogue as a resilient and future-proof solution for organisations of any size.
